Helmets:

Tyres for EVs:

Yes — this document is basically a **sales tax + inventory + sales ledger** for a bike/e-bike business. It tracks each unit from purchase to sale, along with cheque payments, tax, and profit.

What this document is

Your sheet is recording **one bike per row**. For each bike, it stores:

- order date
- inventory/arrival date
- chassis number
- motor number
- model
- colour
- purchase price
- selling rate
- selling date
- cheque/payment details
- tax per unit
- margin/profit
- item short name

That means this is not only a tax file. It is actually a mix of:

- **inventory management**
- **sales management**
- **purchase tracking**
- **payment tracking**
- **sales tax calculation**
- **profit/margin reporting**

You also have summary-style payment notes at the bottom with cheque number, bank, date, amount, and number of bikes in that order.

What the software should do

You need a **Dealer Management Software** or **Sales Tax & Inventory Software** for e-bikes.

A simple version of the software should have these modules:

1. Purchase Entry

When new bikes are purchased, software should save:

- supplier name
- order date
- inventory date
- chassis number
- motor number
- model
- color
- purchase price

2. Stock / Inventory

Software should show:

- which bikes are in stock
- which bikes are sold
- which bikes are returned
- stock by model, color, and date

Because your document tracks chassis and motor numbers, each bike should be treated as a **unique item/serial unit**.

3. Sales Entry

When a bike is sold, software should save:

- selling date
- selling rate
- customer details
- payment method
- cheque / bank details
- invoice number

4. Tax Calculation

Your document has a column for **0.1% tax per unit paid**. Software should automatically calculate tax for every sold item or purchased item, depending on your business rule.

5. Margin / Profit

Software should auto-calculate:

```
Margin = Selling Rate - Purchase Price - Tax - Other charges
```

Right now you are manually writing margins like 17,739, 27,649, 40,306, etc. The software should calculate this by itself.

6. Bank / Cheque Tracking

Your sheet includes bank and cheque references like:

- UBL cheque
- Meezan cheque
- cheque number

- cheque amount
- order-wise payment totals

So the software should track:

- cheque number
- bank name
- cheque date
- amount
- cleared / pending / bounced status
- linked bikes against that payment

7. Returns / Adjustments

Your file has notes like:

- returned amount
- cheque to be issued
- receiving
- ledger difference

So software should also support:

- return entry
- refund entry
- debit/credit adjustment
- ledger notes

What kind of software this is

The software is best described as:

“Bike Dealer Inventory, Sales Tax, and Payment Management Software.”

Or more simply:

“Inventory + Sales + Tax + Cheque Management System.”

Who will use it

This software would mainly be used by:

- owner
- accountant
- sales staff
- stock/inventory manager

Main screens in the software

The software should have these screens:

- Dashboard
- Purchase Entry
- Inventory Stock List
- Sales Entry
- Customer Ledger
- Supplier Ledger
- Cheque Register
- Tax Report
- Profit Report
- Returns/Adjustments
- Model-wise Stock Report

Reports you should get

From this document, the software should generate reports like:

- current stock report
- sold bikes report
- unsold bikes report
- model-wise sales report
- tax paid report
- margin/profit report
- bank cheque report
- purchase vs sales summary
- daily/monthly ledger report

Best software approach for you

You have 3 practical options:

Option 1: Excel-based system

Best if you want something very cheap and quick.

- easy to start
- limited controls
- not ideal for growth

Option 2: Custom desktop/web software

Best if this is your regular business process.

- made exactly for your work

- tracks serial numbers properly
- can print invoices and reports
- can manage tax and cheques together

Option 3: ERP / accounting software with customization

Examples are general accounting/inventory systems.

- faster than building from zero
- but may not fit your exact bike-unit tracking unless customized

My recommendation

For this document, the best solution is:

a custom simple web-based software with:

- bike-wise stock tracking
- chassis/motor unique entry
- sale entry
- tax auto calculation
- cheque/bank tracking
- margin report
- return/adjustment ledger

That is because your business is **unit-based**, not just quantity-based. Each bike has its own chassis and motor number, so ordinary simple POS software is usually not enough.

In simple words

Your current document is manually doing the work of a business system.

The software you need is one that will:

- store every bike separately
- track purchase to sale
- calculate tax automatically
- calculate profit automatically
- track cheque payments
- show stock and reports instantly

The next best step is to convert this into a proper **software requirement document** with:

- fields
- modules
- user roles
- reports
- workflow

I can turn this into a complete software requirements document for a developer.
